Announcements

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ pset7: returned
- ▶ quiz1: Wednesday, 11/16 during lecture
 - ▶ same locations as last time
 - ▶ course-wide review video posted online

- ▶ CS50 seminars:

<https://manual.cs50.net/Seminars>

Today

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ quiz1 review
- ▶ data structures
- ▶ bitwise operators
- ▶ HTML
- ▶ CSS
- ▶ PHP
- ▶ SQL
- ▶ JavaScript + DOM
- ▶ practice problems

Arrays

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ an array is a contiguous piece of memory
- ▶ in C, arrays have a fixed size determined at declaration and consist of a single type
 - ▶ PHP and JavaScript arrays don't have these limitations
- ▶ insertion: N/A
- ▶ lookup: $O(1)$
 - ▶ address of element = index * size of each element

Linked Lists

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ series of structs pointing to each other
 - ▶ elements can be inserted and removed regardless of language
- ▶ insertion: $O(n)$, but $O(1)$ possible if values are just inserted at beginning of list
- ▶ lookup: $O(n)$

```
typedef struct node {  
    int value;  
    struct node* next;  
} node;
```

Linked Lists

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

▶ insertion

- ▶ `malloc` space for a new node
- ▶ make the `next` field point to what will be the next element in the list
- ▶ make the `next` field of what will be the previous element point to the new element

Linked Lists

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

▶ iteration

- ▶ create an iterator (pointer to a struct), which should NOT be `malloc`'d
- ▶ make the iterator point to the root node of the list
- ▶ after visiting a node, make the iterator point to the element specified in the `next` field
- ▶ when `iterator == NULL`, list has been iterated over

Linked Lists

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

▶ deletion

- ▶ use an iterator to find the node to be deleted
- ▶ make the `next` field of the previous node point to the `next` field of the node to delete

Linked Lists

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

▶ example time!

▶ `list.c`

Stacks

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ when adding a new element, add to “top”
- ▶ when removing an element, take from “top”

Queues

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ when adding a new element, add to “top”
- ▶ when removing an element, take from “bottom”

Stacks/Queues

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ can be implemented using linked lists!
- ▶ stack: add new element to end of list, remove elements from end of list
 - ▶ or, add new element to beginning of list, remove elements from beginning of list (faster!)
- ▶ queue: add new element to end of list, remove elements from beginning of list
 - ▶ or, add new element to beginning of list, remove elements from end of list
 - ▶ speed depends on which you do more: insert or remove?

Hashtables

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ hash function maps a key to a value
 - ▶ converts string into numerical index in the hashtable
- ▶ collision handling
 - ▶ chaining: each element of hashtable is a linked list of keys that hashed to that index
 - ▶ probing: store element in another (predictable) location in the table
- ▶ insertion/lookup: $O(1)$ (runtime of hash function can be considered $O(1)$)

Binary Trees

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ just like linked lists, but each node can have two children instead of one

```
typedef struct btree_node {  
    int value;  
    struct node* left;  
    struct node* right;  
} btree_node;
```

Binary Trees

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ invariant: condition that must be held true as elements are inserted/removed
- ▶ binary tree has two invariants
 - ▶ value of left node must be less than value of parent node
 - ▶ value of right node must be greater than value of parent node

Binary Trees

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ insertion/search is best done recursively
 - ▶ just like binary search!
- ▶ compare new/search value to value of root node
 - ▶ if greater, then make right node new root node and repeat
 - ▶ if less, then make left node new root node and repeat
- ▶ insertion/lookup: $O(\log n)$

Binary Trees

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **example time!**
 - ▶ `binarytree.c`

Bitwise Operators

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ `&`: and (both bits must be a 1)
- ▶ `|`: or (either bit can be a 1)
- ▶ `^`: xor, aka exclusive or (only one bit can be a 1)
- ▶ `>>`: right shift: move all bits over to the right
- ▶ `<<`: left shift: move all bits over to the left
- ▶ `~`: negation (flip all bits)

Bitwise Operators

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ $2 \& 3 = 0010 \& 0011 = 0010 = 2$
- ▶ $13 | 2 = 1101 | 0010 = 1111 = 15$
- ▶ $7 \wedge 3 = 0111 \wedge 0011 = 0100 = 4$
- ▶ $5 \ll 2 = 00000101 \ll 2 = 00010100 = 20$
- ▶ $15 \gg 2 = 00001111 \gg 2 = 00000011 = 3$
- ▶ $\sim 13 = \sim 1101 = 0010 = 2$

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **HTML: HyperText Markup Language**
 - ▶ which is *still* not a programming language
- ▶ describes the structure and content of web pages

HTML

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ page elements defined by tags
 - ▶ `<h1>welcome!</h1>`
- ▶ tags can have attributes that specify certain properties of the tag
 - ▶ `CS50`

- ▶ CSS: **C**ascading **S**tyle **S**heets
- ▶ HTML describes structure and content, CSS describes aesthetics
- ▶ consists of selectors and rules
 - ▶ selector: determine what elements to style
 - ▶ rule: define what styles should be applied

▶ selector syntax

- ▶ `<tag>`: select all elements with the given tag
- ▶ `#<id>`: select all elements with the given ID
- ▶ `.<class>`: select all elements with the given class
- ▶ `<tag1>, <tag2>`: select all elements with either of the given tags
- ▶ `<tag1> <tag2>`: select all elements with tag `tag2` that are descendants of `tag1`
- ▶ `<tag>#<id>`: select all elements with the given tag and ID
- ▶ `<tag>.class`: select all elements with the given tag and class

- ▶ 3 ways to style your page with CSS
 - ▶ create an external stylesheet, then use the `<link>` tag to add it to the page
 - ▶ example: `<link rel="stylesheet" type="text/css" href="style.css" />`
 - ▶ use the `<style>` tag
 - ▶ example: `<style> a { color: red; } </style>`
 - ▶ use the `style` attribute
 - ▶ example: `<p style="width: 300px;">`

PHP

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ PHP stands for **PHP Hypertext Processor**
 - ▶ which is *still* cool
- ▶ PHP is server-side: code runs on the server **BEFORE** it is downloaded by the browser
- ▶ PHP is interpreted: no need for compiling
- ▶ PHP is dynamically-typed: no need to declare types of variables or functions, PHP figures that out for you
- ▶ PHP variables must start with a dollar sign
 - ▶ which is *still* annoying

▶ syntax example

```
$x = 5; $string = "hello, ";  
// best function ever coming your way  
function increment($number) { return ++$number;  
if ($x == 2)  
    echo $string + "number two";  
else  
    echo "dr. evil";
```

SQL

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ database consists of tables, which consist of columns (of different types)
- ▶ 4 types of statements (CRUD)
 - ▶ **create:** INSERT
 - ▶ **read:** SELECT
 - ▶ **update:** UPDATE
 - ▶ **delete:** DELETE

SQL

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **create:** `INSERT INTO <table> (<column1>, <column2>, ...) VALUES (<value1>, <value2>, ...)`
 - ▶ `INSERT INTO users (username, password) VALUES ('tommy', 'secret')`
- ▶ **read:** `SELECT <column1>, <column2> FROM <table> WHERE <column3> = <value3>`
 - ▶ `SELECT password FROM users WHERE username = 'tommy'`

SQL

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **update:** UPDATE <table> SET <column1> = <value1>, <column2> = <value2> WHERE <column3> = <value3>
 - ▶ UPDATE users SET password = 'moresecret' WHERE username = 'tommy'
- ▶ **delete:** DELETE FROM <table> WHERE <column> = <value>
 - ▶ DELETE FROM users WHERE username = 'djm'

PHP + SQL

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **execute a SQL query:** `mysql_query($query)`
 - ▶ returns a MySQL resource, not an array
- ▶ **convert resource into an array:**
`mysql_fetch_array($resource)`
 - ▶ returns an associative array where columns are keys, values are values

JavaScript

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ JavaScript is client-side: code runs on the client AFTER it is downloaded by the browser
- ▶ JavaScript is interpreted: no need for compiling
- ▶ JavaScript is dynamically-typed: no need to declare types of variables or functions, JavaScript figures that out for you
- ▶ JavaScript is *still* the best language ever
 - ▶ even if you disagree after pset8

JavaScript

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ `var` keyword limits variable scope to the current function (not loop)
 - ▶ without `var`, variable is a global
- ▶ array declaration: `array = [];`
 - ▶ `array[5] = 10;`
- ▶ object/hash declaration: `object = {};`
 - ▶ `object["name"] = "tommy";`
 - ▶ `object.color = "red";`

JavaScript

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ `for-in` loop can be used to iterate over an array or hash

```
for (var item in collection)
    alert(collection[item]);
```

JavaScript

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ JavaScript can be used to handle page events (interactions from the user)
- ▶ events include: `onclick`, `onmouseover`, `onmouseout`, `onkeypress`, **etc.**
- ▶ two ways to attach event handlers to elements
 - ▶ JavaScript: get DOM object, then add property for event name
 - ▶ HTML: use attributes like `onclick` and `onmouseover` and set value equal to name of function

DOM

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ DOM: **D**ocument **O**bject **M**odel
- ▶ when your browser parses a web page, it stores a representation of its structure in the global `document` object
- ▶ `document.getElementById(id)` used for retrieving an element with a specific id

DOM

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **example time!**
 - ▶ `events.html`

AJAX

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **AJAX: Asynchronous JavaScript And XML**
- ▶ allows JavaScript to make GET/POST requests to URLs
- ▶ functionality provided by the `XMLHttpRequest` object

- ▶ making an AJAX request
 - ▶ create an XMLHttpRequest object
 - ▶ construct the URL to make the request to
 - ▶ create an event handler to handle the server response (onreadystatechange)
 - ▶ request is complete when HTTP status code is 200 and AJAX readyState is 4
 - ▶ open and send the request

AJAX

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ **example time!**
 - ▶ `ajax.html`

Tries

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ specialized form of tree
 - ▶ NOT a binary tree, since each node has more than one child
- ▶ each node corresponds to a single letter in a word
 - ▶ each child node represents the next letter in a word

```
typedef struct trie_node {  
    char letter;  
    int is_word;  
    struct trie_node* children[27];  
} trie_node;
```

Tries

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

▶ insertion/lookup

- ▶ start at first letter of word to insert/lookup and root node of trie
- ▶ check if child exists for the current letter
- ▶ if so, make that child node the new root node and recurse
- ▶ if not, create new node and make that the new root node (insert) or word is not present (lookup)
- ▶ when no more letters in word, get/set value of `is_word` field

Practice Problems (Doug Lloyd)

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ which is faster?
 - ▶ logarithmic or linear?
 - ▶ exponential or polynomial?
 - ▶ linearithmic or quadratic?

Practice Problems (Doug Lloyd)

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ If we have this line in our program:

```
int array[] = {1,2,3,4};
```

What is the value of the following expression?

```
* (& (* (array+1)))
```

Practice Problems

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

id	username	password
1	malan	bowdenfever
2	chartier	ohai
3	rbowden	bieber

- ▶ **get** chartier's password
- ▶ **change** rbowden's password to heartthrob
- ▶ **delete** malan from the database

Practice Problems

week10

Tommy
MacWilliam

Data
Structures

Bitwise
Operators

HTML

CSS

PHP

SQL

JavaScript +
DOM

Practice
Problems

- ▶ 2009: 12, 15, 23, 26-27
- ▶ 2008: 1-3, 5, 15
